

Question 2 (14 points): Two versions of a function that changes the endianness of the elements of an array stored in memory are shown below. Assume that this function is executed in a processor where the ALU instructions (`slli`, `add`, `srli`, `or`, `addi`) take, on average, one clock cycle; control-flow instructions (`bnez`, `jalr`, `blt`, `jalr`) take, on average, three clock cycles; and memory instructions (`lw`, `sw`, `lbu`, `sb`) take, on average, five clock cycles to execute.

```

241 ChangeEndianness_A:
242     slli t0, a1, 2          # t0 <- 4*n
243     add t1, a0, t0          # t1 <- &A[n]
244     bnez a1, nextWord
245     jalr zero, ra, 0
246 nextWord:
247     lw t2, 0(t0)            # t2 <- AAAAAA BBBB BBBB CCCCCC DDDDDDD
248     slli t3, t2, 24          # t3 <- DDDDDDD 0000000 0000000 0000000
249     srli t4, t2, 8           # t4 <- 0000000 AAAAAA BBBB BBBB CCCCCC
250     slli t4, t4, 24          # t4 <- CCCCCC 0000000 0000000 0000000
251     srli t4, t4, 8           # t4 <- 0000000 CCCCCC 0000000 0000000
252     srli t5, t2, 16          # t5 <- 0000000 0000000 AAAAAA BBBB BBBB
253     slli t5, t5, 24          # t5 <- BBBB BBBB 0000000 0000000 0000000
254     srli t5, t5, 16          # t5 <- 0000000 0000000 BBBB BBBB 0000000
255     srli t6, t2, 24          # t6 <- 0000000 0000000 0000000 AAAAAA
256     or t3, t3, t4           # t3 <- DDDDDDD CCCCCC 0000000 0000000
257     or t5, t5, t6           # t5 <- 0000000 0000000 BBBB BBBB AAAAAA
258     or t3, t3, t5           # t3 <- DDDDDDD CCCCCC BBBB BBBB AAAAAA
259     sw t3, 0(t0)            #
260     addi t0, t0, 4           # p++
261     blt t0, t1, nextWord
262     jalr zero, ra, 0

265 ChangeEndianness_B:
266     mv t5, zero             # i <- 0
267     bnez a1, nextWordB
268     jalr zero, ra, 0
269 nextWordB:
270     lbu t1, 0(t0)           # t1 <- 00000000 00000000
271     sb t1, 3(t0)
272     lbu t2, 1(t0)           # t1 <- 00000000 00000000
273     sb t2, 2(t0)
274     lbu t3, 2(t0)           # t1 <- 00000000 00000000
275     sb t3, 1(t0)
276     lbu t4, 3(t0)           # t1 <- 00000000 00000000
277     sb t4, 0(t0)
278     addi t5, t5, 1
279     blt t5, a1, nextWordB
280     jalr zero, ra, 0

```

- a. (3 points) If the value of `a1` is zero, what is the CPI for an execution of `ChangeEndianness_A`?

Only the instructions in lines 242-245 will execute. Thus, the CPI for this execution is:

$$\text{CPI}_{a1=0} = \frac{1 + 1 + 3 + 3}{4} = 2 \frac{\text{clocks}}{\text{instruction}} \quad (1)$$

- b. (3 points) What is the CPI for an execution of `ChangeEndianness_A` in which `a1` is very large?

If `a1` is very large, then only the instructions inside the loop matter:

$$\text{CPI}_{a1 \text{ large}} = \frac{2 \times 5 + 12 \times 1 + 3}{15} = 1.67 \frac{\text{clocks}}{\text{instruction}} \quad (2)$$

- c. (4 points) An execution of `ChangeEndianness_A` in which the value of `a1` is `0x00010000` runs in a 4 GHz RISC-V processor. How long does this execution of `ChangeEndianness_A` takes?

$$0x00010000 = 2^{16} = 2^6 \times 2^{10} = 64 \times 1024$$

$$\begin{aligned}
 \text{Execution Time} &= \frac{64 \times 1024 \times (2 \times 5 + 12 \times 1 + 3)}{4 \times 10^9} \\
 &= \frac{64 \times 1024 \times 25}{4 \times 10^9} = 16 \times 1024 \times 25 \times 10^{-9} \\
 &= 409600 \times 10^{-9} = 409.6 \times 10^{-6} \text{ seconds} = 409.6 \mu s
 \end{aligned}$$

- d. (4 points) An execution of `ChangeEndianness_A` and an execution of `ChangeEndianness_B` receive the same very large value in `a1`. Both functions run on the same computer with the same clock frequency. Which version is faster and by how much?

Assume that the number of iterations in the loop for both executions is K and that the clock frequency for this computer is F

$$\begin{aligned}\text{Time}_A &= (2 \times 5 + 12 \times 1 + 3) \times \frac{K}{F} = 25 \times \frac{K}{F} \\ \text{Time}_B &= (8 \times 5 + 1 + 3) \times \frac{K}{F} = 44 \times \frac{K}{F} \\ \text{Speedup} &= \frac{44}{25} = 1.76\end{aligned}$$

`ChangeEndianness_A` is 1.76 times faster than `ChangeEndianness_B`.
